Question #10

- A. Use your properties of determinants: First add row one to row three, then expand by the third column since it now has three zeros. This will give you -2 multiplied by its minor which gives you an answer of -66.
- B. Use your properties of determinants: Multiply third row by -2 and add it to the fourth row. Then expand by the fourth column because it will now have three zeros. You will get -1 multiplied by its minor which will give an answer of -27
- C. Sum of digits must be divisible by three: 111, 444, 555, 666, 888 = 5
114, 441, 558, 885, = 4 times three which equals 12: 156, 168, 456, 468 equals four times six which is 24.
Add 5, 12, and 24 to get 41.
- D. $8! \left(\frac{3}{4}\right) \left(\frac{1}{2! \bullet 2!}\right) = 7560$: Can't lead with zero: Zeros and threes must be divided out because won't create different number.
