- 9. D—The set of points satisfying the equation form a closed curve that encloses a region. This curve is preserved if we transform  $x \rightarrow -x$  and  $y \rightarrow -y$ , so it is symmetric in all 4 quadrants. In particular, we can find the area in the first quadrant. In this quadrant, we can rewrite our equation as  $y = 1 - x^{2/5}$ . This curve intersects the coordinate axes at (0, 1) and (1, 0), and it is continuous, so the area is

$$
A = \int_{0}^{1} (1 - x^{2/5}) dx = \frac{2}{7}.

 The total area is  $4A = \frac{8}{7}.$ 

10. D—The number of theorems proven is  $(s + \ln c)(24 - s - \frac{c}{12})$ . 12  $s + \ln c$  (24 –  $s - \frac{c}{12}$ ). Differentiating with respect to *s* gives 1  $24 - \frac{c}{12} - 2s - \ln c = 0$ , so  $s = 12 - \frac{c}{24} - \frac{1}{2} \ln \frac{c}{2}$ Fine number of theorems proven is  $(s + \ln c)(24 - s - \frac{c}{12})$ . Differentiating with respect to s gives<br>  $-\frac{c}{12} - 2s - \ln c = 0$ , so  $s = 12 - \frac{c}{24} - \frac{1}{2} \ln c$ . This is a maximum since the second derivative is -2.

$$
24 - \frac{c}{12} - 2s - \ln c = 0, \text{ so } s = 12 - \frac{c}{24} - \frac{1}{2} \ln c.
$$
 This is a maximum since the second derivative is -2.  
Plugging this back in and simplifying gives  $(12 - \frac{c}{24} + \frac{\ln c}{2})^2 = f(c)^2$ . This differentiates to  $2f'(c)f(c)$ , so the derivative will be zero when either  $f(c)$  or  $f'(c)$  is zero.  $f(c) = 0$  is too difficult to solve, but

The characteristic equation is  $r^2 - r - 2 = 0 \implies r = -2$ ,  $r = 1$ .<br>So, the general solution to the differential equation is  $y = c_1 e^{-x} + c_2 e^{2x}$  with  $y' = -c_1 e^{-x} + 2c_2 e^{2x}$ , Using the initial conditions, one can solve  $c_1 = 2$ ,  $c_2 = 0$ .
